

Lab: Create and deploy chaincode to the IBM Blockchain service on Bluemix

Overview

This lab introduces you to chaincode development by showing you how to create a blockchain service in IBM® Bluemix® and how to deploy your first chaincode to the new service.

Tip: This lab uses the IBM Bluemix interface in the Classic Experience view. If you log in to Bluemix and want to work in the Classic Experience UI, click **Go to Classic Experience** at the top of the page.

Prerequisites

To complete this lab, be sure you complete the previous two labs “Transfer assets in a business network” and “Explore the IBM Blockchain service on Bluemix.”

You also need:

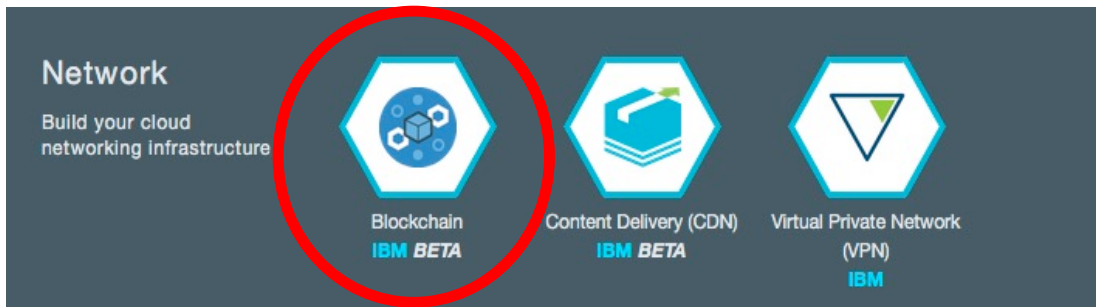

- A [Bluemix account](#)
- Firefox or Chrome browser

If you want to edit and compile chaincode yourself, you need:

- A GitHub account and tools from <https://github.com/>
- The Go programming language compiler from <https://golang.org/dl/>

Step 1. Create a new IBM Blockchain service on Bluemix

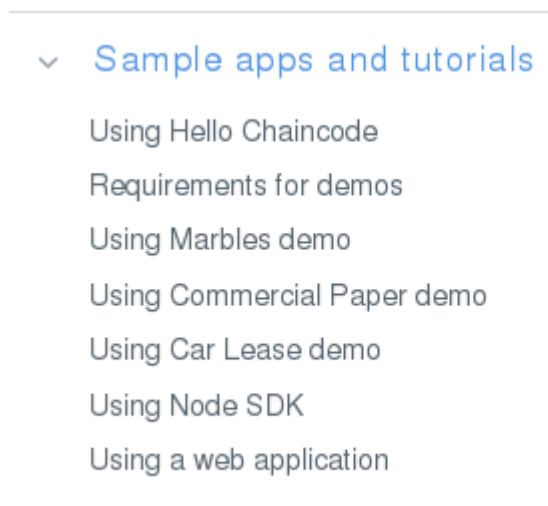

1. Create a new IBM Blockchain service instance in Bluemix for your chaincode. From a browser, log in to <http://www.bluemix.net>.
2. Click **CATALOG** from the top bar.
3. Scroll down to the **Network** section and click **Blockchain**. Review the service information.

4. Click **Create** to create a new blockchain service. Use the default settings.
The service welcome page provides details about IBM Blockchain Network Service Test Environment. Review this page for more information. For more information about blockchain, see [About blockchain](#).
5. Click **Docs** to see the article “Getting started with Blockchain (Beta).”

6. Click **Sample apps and tutorials** in the right navigation.

7. Open the tutorial “Using Hello Chaincode.”

Using the Hello Chaincode tutorial

This tutorial demonstrates the basic building blocks and functionality necessary to build an elementary chaincode application. You will be incrementally building up to a working chaincode that will be able to create generic assets. Then, you will interact with the chaincode by using the network's API. After reading and completing this tutorial, you should be able to explicitly answer the following questions:

- What is chaincode?
- How do I implement the chaincode?
- What dependencies exist?
- What are the major functions?
- How do I pass different values to my arguments?
- How do I securely enroll a user on my network?
- How do I compile my chaincode?
- How do I interact with my chaincode by using the REST API?

What is chaincode?

Chaincode is a piece of code that lets you interact with a network's shared ledger. Whenever you 'invoke' a transaction on the network, you are effectively calling a function in a piece of chaincode.

- > About
- > Managing chaincode
- ✓ Sample apps and tutorials
 - Using Hello Chaincode
 - Requirements for demos
 - Using Marbles demo
 - Using Commercial Paper demo
 - Using Car Lease demo
 - Using Node SDK
 - Using a web application

Continue to the next page in this lab and **Step 2** for instructions on how to proceed through the "Hello Chaincode" tutorial.

Step 2. Follow the Bluemix tutorial to edit your first chaincode

There are two ways you can approach this tutorial:

If you are a developer who wants to write chaincode

You should follow all the steps. Install the Go compiler and use a Git account and tools to change and deploy your code. At a high level, the tutorial guides you through these steps:

1. Set up the environment.
2. Set up GitHub and fork the example “Hello Chaincode” repository.
3. Clone the “Hello Chaincode” fork to your local system; be sure you clone the forked version and not the original.
4. Edit the `chaincode_start.go` file to add a new capability to invoke and query the chaincode.
5. Commit your local changes with the command `git commit -a`
6. Upload your changes back to your forked repository with the command `git push`

Tip: If you accidentally clone the original “Hello Chaincode” repository, you can use the following command to point to your fork instead of the original:

```
git remote set-url origin https://github.com/<yourGitID>/learn-chaincode
```

7. Interact with your changes by using the Swagger API to deploy, invoke, and query the new chaincode that you made.

If you only want to see how chaincode works

You don't need to follow the steps for setting up Go and using Git to make changes. Instead, read the earlier sections of the tutorial and simply deploy and work with the finished version of the chaincode directly when you get to the section in the tutorial “Deploying the chaincode.”
